

Think of the many cyber catastrophic scenarios that may tsunami you when you least expect. Just about each and every one of those horror scenarios can be recovered from by using a shared, virgin sequence of random bits: you can convert them to a replacement cryptographic key, you can use them to replace the defunct ciphersystem you trusted until it failed you, you can use them to authenticate message and messenger alike. In the cryptographic kitchen today, random bits are like salt in its culinary analogy: used everywhere!

Recovery Sticks

Your Cyber Life Preserver --
The Least Expensive, Most Useful Tool
in Your Cyber Recovery **First-Aid** kit

by AGS Encryptions Ltd.
AGSgo.com

AGS Encryptions Ltd. will fit you with its patent pending Recovery Sticks. We will appraise the amount of randomness you and your major communication partners (branch offices?) will need in case of emergency, and then equip you and your partners with physical Recovery Sticks that should be locked in a safe place, and regarded as your critical cyber recovery tool -- hopefully never to be used. Once so equipped you will never need to replace, or maintain them. The Recovery Sticks will lay dormant, locked, their cap sealed (proof of virginity), ready to be used by your recovery team in a variety of ways that is hard to foresee looking forward. Yet, it is easy to assert that randomness -- exclusively shared by the two communication partners that just lost communication -- will come in handy. You can even broadcast a complete highly secret database, XORed with the contents of the shared Recovery Sticks, and be calm and assured, with mathematical certainty, that only your partner will be able to convert the broadcast to the lost database.

When disaster strikes, confusion reigns. Old protocols of authentication don't apply any more. Hackers then move in for the kill. And in these dire conditions having the Recovery Sticks handy makes all the difference in the world!

Use the Recovery Sticks to re-establish communication within hubs of your organization, use them to re-connect with major customers or suppliers, use them to recover from a catastrophic wipe-out of your computing center. The AGS supply of random bits, and the imagination and resourcefulness of your recovery team together, is your best bet vis-à-vis the onrushing surprises in our nonlinear world.

AGS Encryptions Ltd. is a noted cyber security firm, the providers of the only at-will intractability ciphersystem that can be used with variable security up to the mathematical unbreakability offered by One-Time-Pad (US Patent #6,823,068). AGS provides non-periodic pseudo-random bits, with any desired measured randomness, and is a security consultant to those who need to be guided by a carefully thought-out security strategy. We will tailor our Recovery Sticks to your needs.

We are confident that no other means in your cyber recovery arsenal is so effective, versatile, inexpensive, easy to use, a breeze to maintain, and the tool to be grateful for when your recovery is complete.
